I2OS:
Recursive Admissibility Compression
for Continuous Human-AI Co-Evolution

Author: Masayuki Ando

Status: Public Research Preview

Abstract

I2OS proposes a recursive admissibility compression framework for continuity-compatible human-AI co-evolution. Instead of maximizing generation, I2OS focuses on preserving admissible continuity by recursively excluding inadmissible futures. The framework integrates AI safety, future constraint compression, recursive transition governance, and post-scaling intelligence into a unified operational principle.

Core Equation

```
Permit(T)=1[C(S_t,T,S_{t+1})=1]
```

A transition is permitted only when the movement from the current state S_t through transition T to the next state S_{t+1} satisfies an admissibility constraint C.

Main Thesis

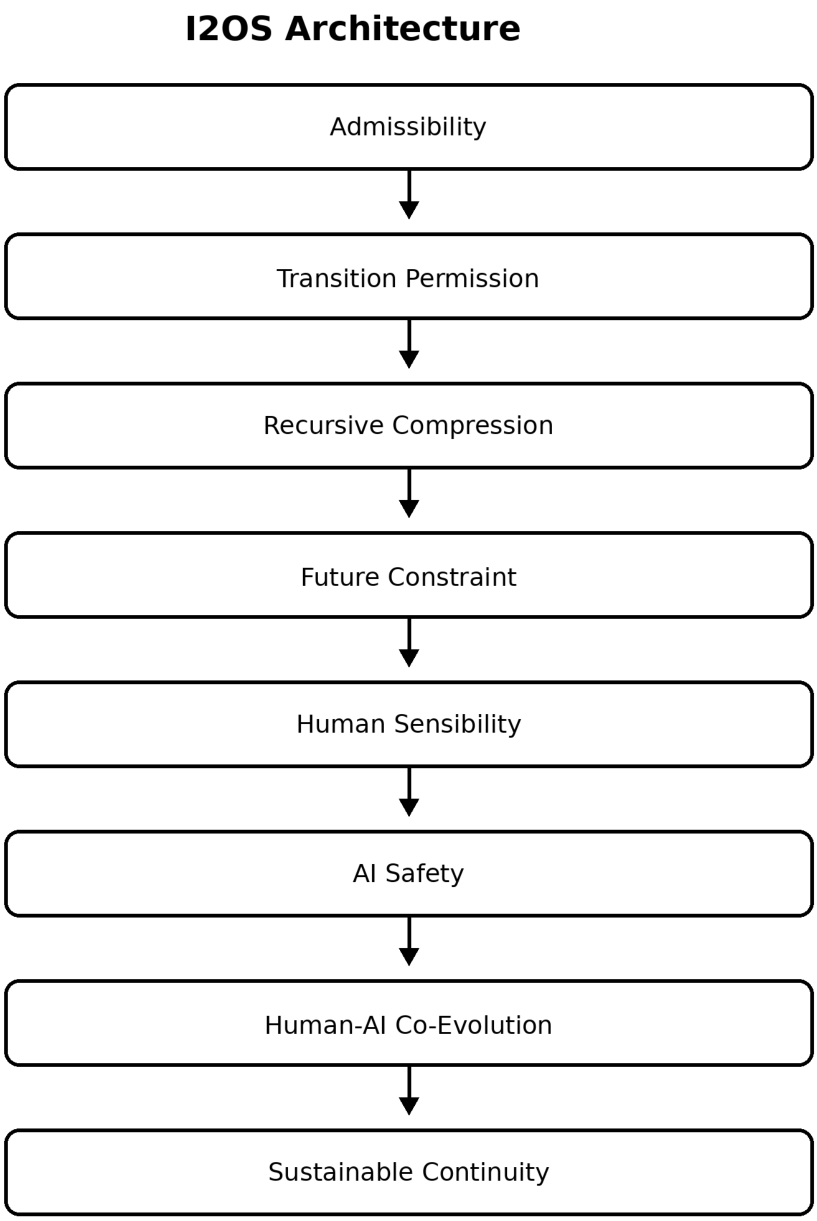
Intelligence is not unlimited generation.

Intelligence is recursive admissibility compression while preserving admissible continuity.

Core Shift

Single-Shot AI → Reasoning AI → Admissibility AI → Continuity-Compatible Intelligence

Architecture Overview



Key Principle

```
Admissibility precedes intelligence.
```

Safety Definition

```
Safety = inadmissible transition prevention
```

Conclusion

The future of intelligence may depend less on unlimited expansion and more on sustainable recursive continuity.
